

saving Word document to os x server

I have noticed some strange behaviour while save Word 2004 documents to our os x (10.2.8) server. When I open the Word 2004 document and make a change, then save it, it takes forever to save the document (by forever I mean 2-3 times longer than with Word vX).

I keep the document open, make another change, then save again, and it takes not so long to save the document (somewhat faster than Word vX). Again making a change, then saving, and faster saving continues until I save and close. If I then re-open the document and save it, it again takes forever to save.

In short: after opening a document if I save for the first time, it takes forever, second and subsequent saves take substantially shorter. Has anyone experience this as well? Any fixes?

Another related subject. Does anyone know why 'fast saves' is not possible when saving to a os x server?

Thanks in advance.
