Hi Arla:

Sorry, I've been away too.

If you cannot "ping" download.microsoft.com using the "Network Utility.app" on your Mac and get a display similar to this:

Ping has started ...

```
PING main.dl.ms.akadns.net (144.135.8.185): 56 data bytes
64 bytes from 144.135.8.185: icmp_seq=0 ttl=56 time=10.940 ms
64 bytes from 144.135.8.185: icmp_seq=1 ttl=56 time=10.403 ms
64 bytes from 144.135.8.185: icmp_seq=2 ttl=56 time=9.195 ms
```

```
--- main.dl.ms.akadns.net ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 9.195/10.179/10.940/0.730 ms
```

Then nothing we can suggest will work. You must engage the support staff at

Re: Office 2004

your ISP. Tell them you can see their home page just fine, you can see www.microsoft.com just fine, but you CANNOT access download.microsoft.com.

That means it's their problem, you know it's their problem. You might state, calmly and unemotionally, that you need this problem solved, because you cannot effectively use your computer until it is. Do not threaten to leave them for another ISP, the person you first speak to would really rather you did :-)

Almost certainly, what has happened is that their anti-spam or anti-piracy activities have disabled an incorrect address, and they do not realise this. Chances are that it affects ONLY the people who connect to your specific terminal server, and chances are that means as few as 250 of their customers are involved and the other 249 haven't noticed the problem :-) Chances are they have thousands of "terminal servers" on their network, scattered across the world, and the bad setting is in only a handful of them...

You need to understand that most large companies set up their "Support" system as "A way to avoid phone calls." That's its purpose: to get rid of you, because talking to you costs them money. Each time you ring, you talk to a different person. Each of the people you talk to was in the unemployment line last week, and are now on the minimum wage. Each of the people you talk to is paid at least partly on commission, dependant on how many calls they "handle" per day. So there is huge pressure on them to dump your call as fast as they can so they keep their call rate up and their call hold time down. This means they will do almost anything except "think" to try to get you off the line.

You have two choices: You can continue to allow them to charge you for a service they are not providing, or you can turn the tables on them. If you would rather not go through life in a very undignified position (!) you can decide to make them fix this! Here's how:

You first need to understand how call-centres work, so you can use their system against them. I know all of this because I recently used to work for one of the world's largest ISPs, so I know how things work on the inside :-)

Re: Office 2004

The first thing you do is ring up and explain what is wrong. It is utterly crucial to avoid giving them "too much" information. They are working down a "decision tree" script on their computer, reading out pre-written questions to you. If you give them too much information, you enable them to turn your call into a different problem. Their computer will automatically gravitate towards problems it knows how to solve, and your call will fall out the bottom with a solution that does not fix the problem.

So tell them: "I cannot access a particular URL on my computer." Then say: "I can access any other URL: for example, I can access your home page, and I can access www.microsoft.com." Try not to give them any more information :-)

Those three facts are quite sufficient to diagnose your problem

However, the call centre jockey you are talking to does not know that (and never will, because they know almost nothing about networking, or anything else on the computer).

What you have said is sufficient to prove that the problem CANNOT be on your computer, it MUST be on theirs :-)

There is one exception to that: your HOSTS file. If the person you are talking to asks you whether you have a HOSTS file, say Yes, you do, but as far as you know, it's the OS X default. If they want to know any more, ask them to tell you where to find it. If they can tell you where to find a Mac OS X HOSTS file, you can trust that person to resolve your problem. It's not difficult, but you have to know how to do it: I will be astonished if you meet a call-centre person who does :-)

I won't explain it here, because before you go to that place on your computer, you need to have someone who knows networking very well on the phone, because a wrong change here will cut your computer off the network completely.

Now, from this first contact, ALL you want to achieve is the Job "Ticket Number". If they do not offer it, ask for it, and keep a careful record of it. This is the digital ID that ties your calls together. Without it, each time you call, that's a "successful call". Everyone gets paid and you don't get your problem fixed.

Re: Office 2004

Ring them again tomorrow, and cite the job ticket number. Immediately, you have triggered an "exception path" in their system. Immediately, money is being deducted from the accounts of the people who should have solved this for you, and immediately your call becomes flagged as a hot potato that they will be looking to hand-off as fast as they possibly can! They will offer to refer the call to "Second level support". Agree to that, as sweetly as you can, and ask the second-level person to call you back (they won't, but it sets another flag in the system...)

Ring them again the day after, and cite the job number again. This time, you have a fighting chance of speaking to someone who knows a little bit about networking. Repeat your original description of the problem. The person you are speaking to this time will know enough to know that this cannot be your problem, it must be theirs, and if you get really lucky, they will be able to solve it for you in a couple of minutes. Usually, however, they will have to escalate your job to the only people in the company who have the authority to make the change needed, so do not expect immediate results.

Call again the next day ... :-)

You see the pattern I am developing here? Each time you ring back, cite the job number. What has happened previously is that each time you call, your contact has been marked "Fresh call, simple problem, resolved, job closed." They get a green tick and you get no service.

By trapping and citing that job number on each call, you "re-open" the job, and each call, it "escalates" to a more senior staff member. Trust me, they WILL solve the problem long before it escalates to anyone senior enough to realise that they have a) screwed up, and b) been treating you badly for weeks. Because that is a bit career-negative for people who are not on the minimum wage, and do have families and mortgages to support :-)

Sorry, I know it's frustrating. It means you have to call at least three times before anyone is even going to look at the problem. But that's the way call centres work, and it's the only effective way to turn their system against them so it (eventually...) provokes some action.

Hope this helps

I receive the same message!
I have tried using Firefox
and Safari and
neither will work. I don't use
Comcast but, RoadRunner
through Time
Warner Cable. I have
searched and searched for
help and no one seems
to know the answer. Please
help.
I'm in the same boat you are
Arla. :)

Hiya—I think I figured out how to ping and it still is
blocked...now
what?

Hello John,

Is that anything on the world you haven't been into? TX for very detailed manual, I will try it ASAP, however I think they will stare at me as I'm completely crazy if I would ask for Job ticket number in this country. Sometimes it seems me that nothing work here. I will try your I'm just BFU approach and see it this will help.

Ok and

Is that anything on the world you haven't been into? should state:
Is there anything on the world you haven't had been into?

.
