That's subjective. What runs acceptably to one person may not be considered acceptable by another. Just reading performance threads on this newsgroup should provide enough evidence of that.

Personally, I'd stick with native Windows hardware for your programming classes. By running VPC all you're doing is adding another layer of potential issues/debugging. And you can bet that if you run into any kind of problems and ask your instructor, tech support, etc for help, all you'll get is "we don't support that on a Mac/VPC/etc".

Wait until you graduate, then get your iBook
