I have OS X (3.9) on my imac.

I'm testing a website I am building using the apache server, but have a problem.

I need my computer to redirect a domain back to itself.

Example.

www.domain.com needs to point back to the localhost.

how can I do this?

so for another example,

If I need to change the setting in the computer to redirect a domain name to another.

If I type www.domain.com for example, I need the computer to redirect www.domain.com to 192.168.0.3 rather than going to the actual domain.

II know it's possible, but I don't know where to start.

PLEASE HELP!!!

.
