Thanks for the kind words, but I'm not an official "MVP". I do, however help run a local Mac users group (the Rhode Island Apple Group) and have been involved in it since the old Apple II days. All Mac users should look up their local groups and join them for a lot of reasons – including having someone to turn to when you need help. To locate a user group go to: [www.apple.com/usergroups](http://www.apple.com/usergroups)

Dear John,

Well, that's exactly what I needed (two weeks ago). But trust me I will treasure and print out your paragraph for my future endeavors with CDs. The key sentence in your 'recipe' is highlighted below!  
So you know, in the beginning of this I went to a convenient computer store that sells Apples (and Oranges) with a single question which should have had as answer your statement. Instead they wanted to sell me ?Toast<sup>1</sup> which made me suspicious. You know the rest of the story.  
Thank you a 1000 X !  
This was an interesting experience. If it were not for you MVP people I would have dished out \$\$ for something I do not need.  
Rudolf  
PS: I am not even sure whether you belong to the MVP group?

OK, in a nutshell, click on the menu item File and then click on New Burn Folder. It will create a folder that you can name and place on your desktop or wherever you want. Then take all the files you want to burn to the CD and move them into that folder. Place a blank CD in the drive and click on the default action in the dialog box that shows up

## Re: Burning CD with Data

once the CD is detected, then all you need to do is click on the burn icon in your burn folder. The default format for the CD will be a hybrid that can be read by both Mac and Windows. If you want to only burn a PC format then select the type of format when you see the burn dialog box.
