When streaming mpg files the lngth gets all screwed, the audio works, and then the video won't play. If I change a setting in performance it works. Then I try o play another, same thing. Then I restore settings. it works. This repeats over and over. WMP 10. Why must there always be wacky problems with anything by MS??

It may be a poorly encoded MPG. But you haven't supplied any URLs or comparative information (e.g. does it work oK in other players) that might help with diagnosis.

1. Check the newsgroups archives for prior discussion or solution of your problems e.g.

<http://groups.google.com/groups?group=microsoft.public.windowsmedia>
Error message codes may be found searching there or via a general web search. Most problems have been addressed here before: don't expect a custom answer.

2. For Windowsmedia newsgroup posting guidelines see http://www.microsoft.com/windows/windowsmedia/mp10/faq.aspx#1_19 . Please supply ANSWERS to the questions there, don't just repeat the questions.

3. Please deliver feedback to the newsgroup, so that others can be helped. No one gets paid to help here, and the response rate from the helped is less than 1%. If that was how medical advancements were made you'd all have died years ago.
