Can you tell me how to use this? How do I get it to go through the media player to find which codec is missing? How to I get it to add the missing codec? As I said, this is one problem I have never encountered before.

I have never had this problem in the five years I have been

Re: Missing Codecs

using the
media
player. I get the message below whenever I click on any live
feed or
video
links. An example is a live cam of baby eagles, another is an
AP news
report.
When I click for information I get the message. The help file
says I am
missing codecs. When I checked the files all the codecs were
there. I
even
uninstalled and reinstalled the media player 10. I've reset all
security
to
original config hoping that might fix the problem. Even
when using my
ISP
that provides it's own media player that is actually part of
media
player
10,
I get the same message. Can someone please help me fix this
problem? It
only
started occuring a few weeks ago. I even tried restore as
soon as it
started
happening and that didn't help. (I checked for the codecs by
matching
them
with the ones on our other computer.)

Windows Media Player cannot play the file because the
specified
protocol
is
not supported. If you typed a URL in the Open URL dialog
box, try using
a
different transport protocol (for example, "http:" or "rtsp:").
