Are these the values you need ? (WM Format SDK)

<http://msdn.microsoft.com/library/default.asp?url=/library/en-us/WMFORM11/htm/errorcodes.asp>

Plus see the intro paragraph for definitions / header files.

HTH

I'm creating a custom PlaylistParser for Windows Media Services 9 (<http://msdn2.microsoft.com/en-us/library/ms741989.aspx>), and at the end of any interface function such as ReadPlaylist, I'm supposed to do a callback and send an HRESULT to indicate success, failure, or a specific error:

```
'indicate success
pCallback.OnReadPlaylist(S_OK, qwContext)
'indicate failure
pCallback.OnReadPlaylist(E_FAILED, qwContext)
'indicate this interface function was not implemented
pCallback.OnReadPlaylist(E_NOTIMPL, qwContext)
```

This may seem like a newbie question, but...where the HECK are these HRESULTs defined? I've added a reference to microsoft.windowsmediaservices and interop_msxml, and I figured they would be in one of those, but when I build the plugin, I get errors that 'S_OK' and the others are not declared. I'd even declare them myself if I could find the correct values. If anyone could shed some light, I'd really appreciate it!
