Thank You David Chen but I am still having trouble ,  
reading the help pages it sounds like anonymous authentication and acl  
authorization would work for my scenario.

Where people are asked to login before live content is streamed over the  
internet (Subscription based).

When I set anonymous authentication and acl authorization and went to the  
web page of my content it asked for my username and password, which is a step  
in the right direction for sure.

But I am having trouble getting passed the login.

On my server, I have been messing with "Local users and groups" and added a  
new user. I'm starting to think this is wrong.

Under ACL Auth' properties on my publishing point I gave user access to read.

Where am I going wrong? Where do I set up user logins and access?

Do I need to install domain controller role? A lot of stuff seems to point  
to active directory, if i need it am i right in assuming I have to load the  
domain controller role?
