Jacky,

Is it that you do not even have NIC on the server or is it just not connected to the network (for ex., is just disabled but installed?).

I haven't installed WMS on a machine that does not have a Network connection, so cannot say for sure if that could be a problem. But if you do have a NIC with an IP, I can't think of a reason why the setup would break.

Anyways, since I don't have any other suggestions, may be the only things left to try is to put it on a network and do an install. Or may be someone else on the newsgroups might have some other ideas.

Thx,
Ravi
