Stream the videos using Windows Media Services, don't put them on your IIS server.

Hi,

I have a website where I upload audio clips using admin panel developed by our programmers. On front end it shows links starting with `mms://doman-name.com/music/filename.asf`

But if a user copy n paste the url in IE and replace mms with http, the song gets downloaded and user can easily save it on the computer.

Is there anyway to prevent/restrict user from downloading and saving asf files?

Windows 2003 standard server with IIS 6 and windows media service

Thanks and regards
