I don't know whether WMP11 support the MMS protocol. I know Microsoft has deprecated it previously.

You should be able to use "[rtsp://server/pubpoint just as well from within WMP, assuming you have those protocols enabled in WMS. You'll also need to ensure port 554 is open \(for TCP at least.\) You can use "rtspt:" to force TCP and "rtspu:" to force UDP.](#)

[Come on folks, can't someone comment on my issue? Surely I'm not to only one with this problem? Please help! Thanks....RDK](#)

[...I have read several recent posts and I believe I understand that video streamed from Window 2000 server and Windows Media Services Version 4 using MMS protocol will no longer work with Media Player 11. Correct? For my part I can not seem to get any protocol to stream to Media Player 11 with my server setup??](#)

[For now I have no choice, I am stuck with Window 2000 Server. If I understand correctly, Windows Media Services Version 9 will only run on Window Server 2003, so I am also stuck with Windows Media Services ver 4.](#)

[Several posts have indicated that I need to change from "MMS" streaming protocol to "RSTP" or "HTTP" in my ASX files. This is pretty straight forward as my application is fairly well contained and available to a small/limited audience.](#)

Re: Streaming Media Services and Media Player 11

However, my tests pasting a modified URL into Media Player 11 using either RSTP or HTTP or modifying selected ASX files did not work and gave me an error message that the file was not found. If I use HTTP and point to the "real" folder on the website (as opposed to the Media Services "alias") then the video plays fine, but I suspect it is not being streamed (??).

Do I have any options for streaming video from this Window 2000 Server to WP11 clients? Do I have to change something on the Window 2000 Server or Media Services to activate RSTP?

Also, what are the operational differences between RSTP and HTTP monikers in my ASX files?

Thanks in advance for any help and advice you can supply.....Rob aka RDK
