Hi all you specialist out there....

I have installed WMS on our intranet server. Out of the box, the demo wmv files play fine. If I go to the WMS control panel, browse to the <default> publishing point, I can test all default installed wmv files. If I add my own wmv file to that directory, and try to test it, the mini mediaplayer window comes up and I'm getting following error:

"Windows media player cannot play the file because the server is not available (for example, the server is busy or not online)"

If I doubleclick my wmv file in explorer, mediaplayer plays the file just fine.

What am I doing wrong here???

Tim
