Hi,

I'm actually planning a new Video capture application for my customers. The application will be used to create a personal presentation video. I must distribute this app to more than 5000 customers...

Once the video is created locally, my application will push the movie created to an FTP or HTTP server.

For compatibility and support, I would like to make sure all videos are encoded with the same standardized codec. I'm actually looking for Microsoft Codecs but I'm not sure what I need and how I can distribute the encoder codecs.

Do my customer need to install the Microsoft Windows Media Encoder? Can I distribute it myself and run a silent install during my application setup?

***Is there an easier way to distribute a video capture application and make sure the codec used for the compression is the same for everyone?

Thanks!

.
