Sue told you the easiest way. If that looks too strange for you then you could also declare it in the Form as a public member. Example:

```
<Form1>
Public MailItem as Outlook.MailItem
</Form1>
```

```
<ThisOutlookSession>
Private Sub myOllItems_ItemAdd(ByVal item As Object)
Dim fm as Form1
...
Set fm=new Form1
Set fm.MaillItem = Item
fm.Show
End Sub
</ThisOutlookSession>
```

I just figured it out.

You have to declare the variable in a standard module as public to pass

it

between a form and "ThisOutlookSession"

Seems kind of strangr to have to declare it in a module that doesn't even use it so I can pass it between two other modules.
