I shut down the computer and then started again. When I started Outlook, none of the VBA kicked in. It is just a simple MsgBox in the Application_Startup sub. Please confirm I don't need to compile it or anything. The code sits in the code window (Alt+F11) and is still there when I restart. So it should run shouldn't it?

Another possible cause of these symptoms is that Outlook is never really shutting down between sessions. If you restart Windows, do you get the same results?

I just found I had this same problem and I checked the Help..About.. and nothing was disabled. My problem is that VBA doesn't seem to get started or be recognized. I have attempted to re-install the Shared VBA part of MS Office, as directed in the Help for Outlook, but it doesn't seem to want to install (remains a white cabinet, not a grey one). Any thoughts?

Did you check Help | About Microsoft Office Outlook | Disabled Items?
