I have windows 2000 pro and office 2000 pr installed on my machine.I recently installed project professional 2003 .Now when I access an internal web site whcih has SSL enabled and try to open a word document as attachment it opens up with ease.But the real problem is while closing the document.As soon as I close the document a client authentication window comes up and says that the web site that I intend to view needs a certificate which I can pick fromt he list .However there is no certificate to pick .I click ok 10 to 12 tiles and the window goes away.It reappears as soon as I try to close any other document which I have opened.This happens only with word documents.pdf,ppt or any other document type causes no problem.Now if I upgrade my office to 2003 the problem goes away.So it looks like that project 2003 kind of modifies a dll or does something to word 2000/xp.Kindly sugest me something.Thanks.
