Hi Robert,

I am noy running 2 antivirus. I uninstalled one before installing the other. I have since uninstalled AVG and tried Outlook without any antivirus installed and still have the same problem. The symptoms appear to me as if it is a memory problem but the only app. that appears to be affected is MS Office. I have run a mtinst and it did not show any memory problems. Is there a way I can check and see if the ram is faulty. The system information is still showing the 324 mb ram that is installed.

Thx,
Rick
