hi,

i am having major issues with upgrading to 2007. all users that have 2007 opening 2003 docs are opening in compatabiity mode, this then makes the machine run like a dog. If i install the converter pack for the 2003 machines and save in 2007 format, all the 2003 machines run like a dog. I will obviolsly have to increase the speed in which i do my upgrades to 2007 so all docs can saved in 2007 format. my problem then is converting all the existing docs. i have looked at the ofc.exe cmd line tool and have some major issues with it.

It doesnt delete the original copy, leaving me with a major headache with users updating the wrong copy of the doc.

i cant seem to set it at a share and let it run, i need to know how many levels i need to go down and set the parameters, this could take forever. has anyone done a bulk conversion easily?

.
