Date: Thu, 01 Apr 2004 03:27:09 -0800

server:
SBS 2k SP2
SUS
ADO
GPO

clients:
WXP SP1
office 2003 pro

i have deployed office 2003 via admin installation point. Also i have applied an update to an Office administrative installation point so now i need to update client computers.

clients have "user rights", not admin rights

can i use setup.exe REINSTALL=all /qb feature in start up script for user so i do not need to log on the user computer as administrator

**

if it is not possible to do that, i assume that i need to deploy office if i want such a feature (update clients without admin rights) via GPO. So suppose that i want to deploy via GPO, do i need to do any special steps because users computers have already installed office via Admin install point.

kind regards
tomislav
