0A4I have two machines both with install problems. i read that the Ohotfix log file might give a clue to why i cna not get an install to work. What do i look for or who cna I send it to to interpret. Also ona laptop i have the SKU0A4.CAB issue. I downloaded the Listool.exe file to a temp directory and tried to open it and it wgave me an error message. Should it be inanother Location?

Also this is a bit ridiculous after the hoopla of such a great update to have all of these issues. Enough said just help please. Thanks
