Hi,

I have added a form to the end on my presentation where the viewer can request more information and the info goes into a txt file. (with help from this group, I might add) Can I get it to put the information for each user on one line instead of in a column so that I can easily import it into Excel when I'm done?

The script I have looks like this:

```
objTS.WriteLine "Name = " & Me.TextBox1.Text  
objTS.WriteLine "Address = " & Me.TextBox2.Text  
objTS.WriteLine "City St Zip = " & Me.TextBox3.Text
```

and comes out like this

```
Name = Elizabeth  
Address = my street  
City = Houston
```

I'd like it to come out like this:

```
Name=Elizabeth Address=my street City=Houston  
Name=Next Person Address=thier street City=some town
```

can this be done somewhat easily?

thanks,
Elizabeth
