I just did this with PP 2002.

Create a hyperlink on your "start" slide, link it to the more detailed slide. On your more detailed slide, make another hyperlink to the original slide. I used blank text boxes, and made the whole text box the link. When you are in viewer mode the cursor turns into a hand when you go over the hyperlinked area, so you know where to click. When you go into the hyperlink dialogue box, you'll find that you can choose to link "to a place in this document", which will then bring up a list of all the slides you have in the presentation, then you can just click on the slide you want.

This is the way I did it (I found help had the details on how to make one hyperlink, slide to slide, but not how to get back). There may be an easier way.
