Hi Steve,

Sorry, I was a bit in a hurry yesterday.

Yes, starting Powerpoint by double-clicking a copy of the file on the HD is without any problems.

But when working on a project (doc's, ppt's stored at a project-folder on the network) it is easier for me to start the programs from Explorer (double-clicking).

It's quite unhandy to make a copy on the HD first.

But when starting from the network PowerPoint is not initialised correctly, though the figures are visible in the thumbnails, they are not in the edit window.

Your solution will work, but it's like your garage suggests you, in case of troubles, to start your car from a downhill slope.
