One more thing, Bill..

When I inserted my userform. the controls toolbox for that Form only show some basic controls (command button, image, text, label...). I would like to add more controls to that toolbox but when I right-click over the toolbox, and then select "Additional Controls..." but nothing happened...

I remember I did the same way with VBA in Excel before and I had a menu opened which showed me more controls to select. But now I go back to Excel and Word and do the same thing but nothing happened...

Could you please advise in this case, Bill?

Thanks very much...

Best regards,
Hao.

Dear Bill,
It's excellent... Your advice is really working good... many thanks for all that...

One more point, now I created 2 autoshapes assigned to 2 macros named "Forward" and "Back". and it's working very well. Now I would like to disable the functions of the mouse outside the surface of these two autoshapes. mean if I click my mouse any point apart from these 2 autoshapes, nothing will happen...

what is the solution for this, Bill???

many thanks again for your help...

Best regards,

more additional controls for userform???

Hao.

This is a known bug/problem/glitch with ActiveX command shapes on slides. They do not become or stay transparent.

You can make a regular autoshape, then attach an action setting to call a macro (just like the previous question). The advantage of using this method is that the autoshape will be able to be made transparent, and will function like a command button.

Dear Bill,

It's wonderful... I remember that I went to "action setting" some times

but

why I couldn't find that point... I need to check my eyes again...hehehe...

I would like to send you many thanks for your help... You are number one,

Bill...

By the way, I have another problem, and you could be able to help me

another

time, I believe...

In my slide, I added a command button and I want its background to be

transparent, I then set its Backstyle property to

0-fmBackstyleTransparent.

more additional controls for userform???

But when I run my slide (F5), it goes back to its original color, not transparent anymore....

To double check this problem, I created 2 command buttons named CommandButton1 and CommandButton2, and then put the following code under CommandButton2:

```
Private Sub CommandButton2_Click()  
CommandButton1.BackStyle = fmBackStyleTransparent  
End Sub
```

...and then set the breakpoints each line of the above code, while running my slide and then click on the CommandButton2, I noticed that the Backstyle value of CommandButton1 change from 1 to 0 (that means change from Opaque to Transparent) but when looking at m,y slide, nothing happened to the backstyle of the CommandButton1...

Do you have any idea about this, Bill??? could you please help me to solve out this problem... Again, It's really appreciated...

All my best regards,
Hao.

Ladies and gentlemen,

Do you know how to assign
a hyperlink to a macro. I
have some text, I
would
like to create a hyperlink for
that text, then when I click
over that
text,
the hyperlink will cause my
assigned macro to run....

I've look through
Powerpoint for hours but I
could find any way to
realize
my idea...

Many thanks for your help..

Best regards,
Hao.
