I have more than one computer – both with windows XP and Office 2003. On one the program works fine – on the other, it doesn't. Could the Microsoft Tech's that monitor these forums

There aren't any, at least not regularly. It's all user-to-user support.

tell us if they are aware – and working on a fix? I don't mean to be impatient – but I need to be able to create CD's of my presentations. It has to be one of the automatic updates that has caused this – don't you think? I personally haven't altered any settings or preferences.

I agree about the update. As I think I mentioned, it's happened on several different PCs here. I've reported it to MS, they've had me run through all sorts of things to try to find a fix, no luck.

If you have a copy of PPT where the feature's still working, you can package a simple file using the options you want, package to folder rather than directly to CD. Then you can substitute the files you really want to package, do some editing to the bat and list files and burn the CD from that folder.

This won't fix up any of your links, unfortunately. If you don't have links, then no problem. If you do have links, see <http://www.pptools.com/fixlinks/>

That points to our commercial link fixing add-in, but there's also info on the site that explains how to fix the links manually.

Recently just tried a Windows XP repair... Still no luck fixing this....
Also tried removing and then reinstalling again after the repair...

Re: how to re-install package for cd and powerpoint viewer

If anyone has some expertise with this problem please advise... I've searched google and only found others scratching their head on this –

Thanks again in advance–
