Thanks, Troy...I will give that a try. I need to get better imaging software. I will look for something online. I still don't understand why it converts the background to black?? or light blue?? Anyone?

"Troy @ TLC" wrote:

You cannot use a .png image for websites as it is not universally supported.

The process I would use:

- Make all images on PPT slide
- Group images
- Right click, choose 'save image'
- change a .png format
- Open the .png in ImageReady, or other image editing application.
- Add a layer below the image that is the website background color
- Save out image as a .jpg
- Add to website

When I opened the PNG file on the website, the background was light blue with a white box around the jpg inserted and grouped with the text.

Try saving as PNG instead. That usually keeps the transparency.

I'm trying to create a logo by using a combination of both Word Art, regular text box and an inserted jpeg file. Once I have them all positioned, I "select all" under the edit menu. Then I right click in side the selected area and chose 'save as' jpeg format as the website I want to use it on only accepts certain formats. Once it is saved and I try to view the image on other software, the back ground has turned from white/transparent to black or light blue with a white box around the first jpeg inserted. I don't see black or light blue anywhere as a background on PP. Why is it changing backgrounds on me and how do I stop it?
Thanks
