First suggestion, which probably won't be the solution but may help prevent other bugs: Don't add apples and automobiles:

```
.Text + nAddAmount
```

isn't a good idea.

```
.Text = Cstr(Val(.Text) + nAmount)
```

or something along those lines might be better. In other words, convert the string in the text box to the number it "looks like", increment that number, then convert the result back to string.

I'd also set break points and step through the code to see exactly how far it gets the first time you click on the link and invoke the macro.

Thank you for your suggestion, Steve. I changed the code to the line you provided, and while it didn't do anything to resolve my problem, I appreciate having the "correct" code.

I did try setting break points, but break points do not get triggered in slideshow mode, but just in edit mode where I am not having a problem.

That's odd ... they work here in either mode. Do you have the VBA editor open when you start the show?

In any case, I'd try David's suggestions first and if no help there, let's come back to this one.

Re: Action Settings work on Windows, but not Mac

I did insert popup message boxes to aid in debugging, and

they show that all of my code is being executed without error, just
that the screen is not being properly updated after a change is made.
