Thanks Austin,

.... in fact a considerable amount of digging around found a parameter in the NVIDIA driver settings that makes the remote screen attached to the laptop VGA port show video full screen. So if a PowerPoint presentation has a video clip it will cause a resync for resolution and speed when it is run.

Having stopped that happening everything is as I hoped for. Modern laptops are getting too smart for themselves and it does not help that only a rudimentary "instruction leaflet" is provided!

James

James not really much you can do. See below:

If I blank the laptop screen it works without re-syncing, but I find the laptop screen useful as it avoids me having to turn away from the audience to look at the screen.

It appears that is how the manufacture and or the device driver has been set up. The only alternative I can think of is to install a second video card (PCMCIA) in the laptop.
