PowerPoint 2007 all latest updates installed running on XP sp2 also up to date.

Ok I've run out of ideas, so please help me.

When you receive a presentation and load it the message bar informs you that "Security Warning References to external pictures have been blocked" and when you try to show the presentation you get the Security Alert "This document references pictues in untrusted locations."

If you cancel the show starts and still runs fine.

I know you can disable the message bar warning but how to you stop the security alert when you try to start the show?

I do not have the luxury of checking the presentations before they have to be shown and it ruins the show having this alert pop up on the odd presentation. The reason they can't be checked is that we pre make a deck with object linked filenames for a whole show and while the show is running the "dummy" files are over written with the real ones live via the network. It is SO unprofessional when that pop up appears.

There has to be a way to disable the warning.
