Hay Austin, I was hoping you would get to my question.. Well I believe I'm kinda limited to some kind of mpeg because windows media player won't play anything else. It wants those codecs... So what I'm doing is using mpeg ( Xvid, Divx compatible ) format and conveting to an AVI file that alows me to create High Def clips.. I'm not sure if there is High def mpeg, I havn't found it.. Depending on the original movie, I'll convert to wide screen if its not already.. I have purchase the AVS4YOU video editer because its simple to use and it alows me to do that.. Also they offer all there products for one price.. What my problem is, I would like to play blueray quality video clips in my presentations and mpeg just doesn't cut it.. Its old news.. New news is blue ray quality.. Have any sugestions on how to make windows media player preform better givin that power point 2007 will only allow the windows media player to play any clips??? How about you tell me the format I should be using and should I convert the file to somthing else for playback in a power point presentation clip?? What I did was try and work the problem untill I got the best result I could find but there are allot of people out there smarter then me and I want to make my presentations in the highest quality as I can.. So here I am...

Power point 2007. My Laptop: HP Pavilion dv6448se Entertainment  
Notebook

Re: What video player do I need to use for high definition video c

Re: What video player do I need to use for high definition video c

PC:

AMD Turion (tm) 64 X2 Mobile tec T1-56 1.80 GHz, 32-bit Operating Sys,  
NVIDIA Graphics, Windows Vista Home Premium, Office 2007

Heres the question. Power Point 2007 presentation (slide show)

What video player can I use to play high definition video clips in a slide  
on a slide show?? I'm talking high quality video, not garbage windows  
media

player 2mpeg stuff. I can make them, edit them, play them all day long  
outside of power point but not in power point. I can play standard video  
clips but havn't found a player to play the clips in High definition that  
power point likes. What am I missing or doing wrong or havn't worked out  
yet??? I'm think a gazilion doller microsoft should have something that  
will

work and play really well like that of a Quick time player. The Quick  
time

player and others can play HD and Blue ray Quality high def clips but  
power

point won't let me play them on a slide in a slide show.. Ok, so what  
player

do you advise I can use that power point will grab onto and play the  
clips??
