I have a single slide with only one item in it. It contains the logo of a potential customer captured from their website. When opening the PowerPoint in 2007, a security warning states:

"References to external pictures have been blocked. If you choose to enable the content, you may be loading content from remote locations, which presents a security risk."

Then farther down it states:

"Warning: This document references pictures in untrusted locations. These references have been blocked."

Does anyone know what might be going on with this graphic to generate this security alert?

How did you "capture" the logo? Please do not insert images with Copy & Paste. Right-click on the image on the website, choose "Save image" and save it to your harddrive. In PowerPoint use Insert – Image and navigate to the place on your harddrive where it is saved. Insert it from there.

If you copy an image from a website with Ctrl+C, the chance is very high, that you involuntarily copy a bit of HTML code which causes that warning message.

Best regards,
Ute
