

## Reference to attachments?

I remember hearing or reading about a program that will save all the attachments in a file to one folder but that will also leave a footprint in the email message about where the attachments were saved and the names of the files, if memory serves.

I don't need that type of thing, precisely. I was hoping there was a way to, yes, put a reference in the email message telling the names of the attached files only. I don't need to know where they were saved, actually, as I move files around a bit before settling on a final location. I get so much mail every day from several yahoo groups that I belong to because email attachments are permitted and we share graphics and graphics challenge results (re Paint Shop Pro), etc. It's a pain to save all the attachments because when I go back to reference a graphic, if it's not with the email msg, it's nearly impossible to find. So I end up just leaving them in the message.

My pst file is slowly growing no matter how diligently I try to keep it down to a "minimum". <g> Yeah, at 85 megs, the pst is down to a minimum alright, even with diligent compacting! <g>

But if there was some sort of script that would allow me to save the graphics to where I want but also leave a reference behind to the exact filename(s) involved? Or if there is anything that might do something like this. I am also open to suggestions for any other type of solution that would accomplish the same type of thing where I'll know the names of the attachments so that I can ultimately delete them from the saved emails.

Thanks so much.
