In Outlook 2003 there is an issue I've never had with previous versions. When I receive HTML e-mail and try to respond to the e-mail it can take up to 30 seconds for the new mail to form. This is quite a long time and I have never had this issue before. Well that's all well and good (hmm....) but the real kicker is this. If I try to start typing my reply immediately after the new mail forms I will GET ThIs. It looks like a resources issue but not in my System. In outlook.exe. So if I just wait another 10 seconds or so after the new mail reply forms then when I type I will get this. Anyone else notice this issue? Do you think it may be a result of using a contemporary software on a machine older then acceptable? This is in Windows 2000 Server with RAM out the wazoo. Thanks.
