I have a very strange problem. I created an Outlook 2003 Installation package that I am pushing through a group policy. In the configuration, I have it set to automatically configure the mailbox based on %UserName% and our exchange server. The package works great on all of our systems except the Dell GX 150's. I have tried it on a GX1, 110 and a 270.

The problem I get with the 150's is that outlook says it cant find the mail server. I can however ping the mailserver from that workstation.

Does anyone have any Idea????

thanks
