Scott thanks for your input and it may be that you are in the right area however I am not sure. I have recently changed from a small P2P XP network to client server network running Windows Server 2003 small business server which is a packaged deal including Exchange Server, however I have not attempted to set up the Exchange Server. When I activated Outlook 2003 I set up my pop accounts with my isp directly the same as it was set up in Outlook Express. However my primary reason for activating Outlook 2003 is because everytime you log in on a workstation with Express running you get a warning that there is no default email client so something in the system wants Outlook 2003 not Express which may mean that even though I haven't set up Exchange Server it may be in the loop. If that is the case I need to know what and how to to change settings on a server that shows a state of services not running

This means that the email has passed through a mail server > that doesn't support HTML messages, and has stripped out the formatting and downgraded it to Plain Text. If this is the case, this will be out of your control.
