Brian,

I am using an Exchange account for all my users. Currently, they are using Outlook 2000 (configured as Internet mail) for interoffice mail and OWA when they are out of the office. I want to upgrade them to Outlook 2003, but I don't know what protocol to use to set them up. The way it is now, if they receive a message and use Outlook 2000 to open it up, then they won't see it in OWA or vice versa. Sending messages in OWA can still be seen in Outlook 2000 (I guess because it's using SMTP...I'm not sure). I want both of these interfaces to reflect incoming/outgoing activity. How do I set this up?

OK. I thought OWA used http as the transport. Outlook 2003 uses POP3 or IMAP. How do I configure Outlook2k3 for incoming mail.

Why are you not using an Exchange account for Outlook? Then Outlook and OWA would always show the same thing.
