Hello,

I am having the following problems using Outlook Connector for Domino with Outlook 2003 and Lotus Notes client R5.0.11.

1) In Outlook many mails come with 'DocumentLink.ndl' attachments. If I open these mails with Lotus Notes, these attachments are shown as previous messages to which the actual mail is a followup.

2) Some attachmets are corrupted. I have read some threads about this issue, but no solutions. This happens when the mail is opened whith Outlook, but not with Lotus Notes. I thought it may be a problem of Outlook converting a mail that was written in Lotus RTF, but recently I have found the same problem with a mail that was originally written in HTML. This is not dependant on the the messages been signed, ciphred, signed and ciphred, ...

3) If the mails contain links to Lotus Notes databases and I double click the link then I get an error. But if previously I launch Lotus Notes and then double click in the link I have in the Outlook message then the database gets opened in the Notes Client.

4) If the mails contain links to documents in Lotus Notes databases and I receive the mail when Outlook is running, then the link gets lost and I am not able to follow it neither by Outlook nor by Lotus Notes.

5) If I run the SCANPST.EXE program with the nst file that corresponds to the OLC, I always receive the same error, no matter how many times I run it. The error is:

**Beginning PST/OST recovery

**Attempting to recover all top-level objects

!!Missing template (nid=619)

If anyone would have a solution or workaround for any of these problems, I

Several Outlook Connector for Domino issues

would be very grateful.

Regards,

Fran
