Hopefully someone can help me out here,

I've poked around at CDO, but still cant figure things out here. Basically I've got a bunch of client-side rules that move messages from the Inbox to a public folder. What I've been trying to do is have the rule run when I'm not logged in, now I've tried writing stuff in C# what uses IMAP, but alas... you can't copy a message to a public folder using IMAP with Exchange 2000. Does anyone have any code, know of any applications, or have any other ideas that could help me out?

Thanks!

.
