Greetings!

I've seen many postings similar to my issue but nothing that seemed to pinpoint my problem.

The custom form (OL2002 SP2) in question utilizes VB script to print the form via a MS Word template on both the compose/edit pages and works flawlessly from my Personal Forms Library or an OFT. However once our Exchange admin published the form to the Organization Forms Library, my VB script print button ceased working. After it was deployed, I checked the form properties and neither the 'Send form definition with item' or 'Use form only for responses' are checked; which seems to have caused similar problems with other developers. I've cleared my Outlook cache and removed the form from my Personal Library to eliminate any potential conflicts but I'm still stumped.

The only thing that I thought of was that once it was deployed with my designation of v1.2, the Exchange admin made a change and did not updated the version.

Any thoughts or suggestions would be greatly appreciated.

MEG
