I have an Access 2k database that's used to email customer reports using Outlook with Redemption's DLL. I use a table of Customers contacts to fill all email parameters (Recipient, Subject, Body, Attachment, etc.) and it works just fine. These reports are printed to a PDF driver and subsequently attached to the email and sent.

Occasionally we have to generate reports (same as above) where the recipient is not in the customer table.

Question – Is there a way using Redemptions Objects to create the email without the Recipient but has the Attachment and just open the default mail client in the create new message with the attachment already attached??

This would be similar to using the built in Access SendTo command.

Thanks,

ET Sherman
