I have a third party program that works well with my install off Outlook 2003. and currently they have no way to preload some of the configuration settings.

Some of the settings are:

Using the MAPI Com object the Entry ID for  
Contacts Folder  
Calendar Folder  
Notes Folder  
Tasks Folder

The company stores there settings in the %USERPROFILE%\Application Data..... for each user  
adn a \*.ini file.

I have a vbscript that creates the \*.ini file with the aproprate information with the exception of the EntryID's

Can someone help me by provideing the code to look this information up and save it as a variable so i can add it to my code to write this information to my \*.ini file

Thank you

Paul
