Again, you will get errors trying to instantiate a MAPI.Session if CDO 1.21 is not installed. It's optional and often is not installed.

There are many examples of various logons using CDO 1.21 at www.cdolive.com/cdo5.htm.

A piggy-back logon won't do you any good at all if Outlook isn't running. Here's an example of that:

```
Dim oCDO As MAPI.Session
Set oCDO = CreateObject("MAPI.Session")
oCDO.Logon "", "", False, False
```

For a logon using profile information you will need to know the mailbox and server names and have a Windows logon with permissions on that mailbox. Then you can use something like this:

```
Dim oCDO As MAPI.Session
Dim strProfileInfo As String
Set oCDO = CreateObject("MAPI.Session")
strProfileInfo = "<Your Servername>" & vbLf & "<Your Mailbox>"
oCDO.Logon "", "", False, True, 0, False, strProfileInfo
```

Or you can use the profile name if you know it:

```
oCDO.Logon "<Profile Name>", "", False, True, 0
```

Profile names can be found under HKCU\Software\Microsoft\Windows NT\CurrentVersion\Windows Messaging Subsystem\Profiles. The default profile is listed in a string value in that key named DefaultProfile.
