Sue,

Thanks, I've looked at your site before and I think I looked at this example, but will do so again.

Regarding the error, I listed it in the code where it occurs. I find that when I'm responding to posts, it's always prudent to read them through carefully, especially if I'm going to **advise** them on posting protocol ;).

Regards,

Doug

Yes, it's possible, but not a simple application by any means. Tom Howe's Enterprise Calendar sample would be a good starting point; see <http://www.slipstick.com/calendar/scheduleall.htm>

Whenever you're writing about an error, you ought to at least do your readers the courtesy of explaining **what** error you get.

(I've never cross-posted before, but I'm new to the Outlook newsgroups, and thought I might get a more complete answer in this group than to my post to

Re: Duplicating public folder items in personal folders

another yesterday)

At my office we are in need of a system to remind individuals of upcoming deadlines. We want to centralize the input of the deadlines and to be able to set reminders on different deadliines for different individuals.

We are using Exchange 2003, Outlook 2003 and we use Cached Exchange mode.

Through googling various options, it seems like it's possible to create a system with these features.

- One public calendar with all the deadlines
- Personal copies of the calendar on multiple individuals' computers
- copying, modifying or deleting items from the public calendar to individuals' based on events in the public folder
- reminders set based on whether the individuals username is a checked category

I'd be interested in opinions on whether this is workable, and if so, if there are any examples of the code needed.

If this is workable, I have a specific problem (first of many, I'm sure).

I

wrote ApplicationStartup code to set the items in the public calendar so I could capture the its events and that's working. I then wrote some simple Item_Add event code to copy the added event to my personal calendar. It works if I set a breakpoint and step through. When run without a breakpoint, the item is copied but then I get an error. My wild guess is there is some problem with lag time or cached Exchange mode. I also thought maybe the fact that the code first adds another copy to the public folder was the problem, but I can't tell. In Excel VBA I would try turning off events, but I can't find a way to code that in Outlook.

Here's the code:

```
Private Sub myOllItems_ItemAdd(ByVal Item As Object)
Dim calendar_item As AppointmentItem
' on next line I get the message
' "Method copy of object AppointmentItem Failed
Set calendar_item = Item.Copy
calendar_item.Move
Application.GetNamespace("MAPI").GetDefaultFolder(olFolderCalendar).Folders("schedule
- Doug's test")
Set calendar_item = Nothing
End Sub
```

Again, the code works, it actually copies the added item from the Public folder to mine, but then I get the error and message, which makes me think that it's the 2nd time through. But if I set a breakpoint beforehand, it

Re: Duplicating public folder items in personal folders
only goes through once.
