Can PB handle COM exception (that is how COM returns errors)?
In VB/VBA you can use "on error resume next" and then check the value of err.Number. In other languages try/finally/except/catch blocks are used.
As for SaveAs, this is an indication that the item hasn't been saved, so MAPI (and hence Redemption) cannot see the latest changes. Call MailItem.Save first.

RDOAddressBook.ShowAddressBook simply raises a COM error if MAPI returns anything but S_OK. When the address book dialog, is cancelled, the error is MAPI_E_USER_CANCEL (0x80040113). This is normal, your code should expect and handle that error.

Re: Redemption Question – showaddressbook and saveas

I know this is a VBA group and this is a powerbuilder question BUT I noticed that the author of the Redemption code answers post here so I thought I would try and post my question here

I have a PB application where I would like to show the address book and let the users select the email addresses for the message being sent.

I have the following code and this works as long as the user selects the OK button from the address book dialog. Then everything works like a charm BUT if the user selects Cancel from the address book dialog you get a PB error message

Error calling external object function showaddressbook

I am using the newest version of Redemption and I am using the RDOsession because I need to use the SaveAs function to save the created email as a .msg file and found using the SaveMailitem that this did not work. It would only save an empty email .msg file unless I used oleSafeMailItem.Item.SaveAs(filename,3) AND then you get the dreaded Outlook Security message popup.

```
Session = Create OLEObject  
li_Return = Session .ConnectToNewObject(  
"Redemption.RDOsession" )  
Session .Logon  
Msg = Session .GetDefaultFolder(4).Items.Add(0)  
Msg.Recipients.Add ("rsu...@xxxxxxx" )
```

Re: Redemption Question – showaddressbook and saveas

```
Msg.Recipients.ResolveAll  
Msg.Subject = "Hello"  
Msg.Body = "Testing Applications"  
ab = Session .AddressBook
```

recips = AB.ShowAddressBook(Msg.Recipients) /* This is
the line that
the error message is for BUT this does actually show the
addressbook
but if the user clicks cancel this line then reports the error
and
dies. I have debugged it and it is dying on this line.

```
Msg.Recipients = Recips
```

Any help would be greatly appreciated.

Unfortunately it is not my code causing the error but something
internal to PB ... so maybe I am s**t out of luck!

Do you have any ideas about the savemailitem.SaveAs issue ... why does
this save a blank email msg but when I call savemailitem.item.saveas
it saves the email msg but then I get the security warning?

Thanks
