Did you check your security state yet? If it says "administrator controlled," that means that the Exchange administrator is controlling security and, unless they loosen it for you, you won't be able to run VBA code without security prompts.

Are you trying to create a rule for outgoing messages? The "run a script" action is available only for incoming messages.

If you're getting security prompts with normal Outlook VBA code, using the "run a script" rule isn't necessarily going to get around that. Maybe your VBA code simply isn't constructed properly to derive all objects from the intrinsic Application object. You might also want to tell us the security state shown on the Help | About Microsoft Outlook dialog.

I went through the steps you outlined multiple times, and there's no "run a script" rule. I wonder if my company "turned off" this option?

I was hoping to use this as the VBA procedure I wrote results in the Outlook Security Warning and is useless because of the warnings (my user would have to click 'yes' 400+ times a month). I thought by using the RunAScript rule

Re: STILL IS NOT AVAILABLE... Run A Script not listed in rules wizard

it may prevent the warnings.

"Alan Moseley" wrote:

In Rules and Alerts click New Rule
Click 'Start From A Blank Rule' and choose a Step 1 option.
Click Next
Select one or more conditions and click 'Next'
Under Select Action you should see an option for 'Run A
Script', check
it
and click on the 'a script' hyperlink in the bottom window.
Choose the script that you wish to run.
Continue the remainder of the wizard.

I'm using Outlook 2003. I purchased an
Outlook VBA book, and it
shows
examples of using the rules wizard "run a
script". I do not see this
option
when I go into rules, and I would really like
to use it.
