August, 18 2004. Afalina Co., Ltd. announces the release of a new major version of Add-in Express that supports the .NET technology.

Add-in Express .NET Edition allows you to develop COM add-ins on several platforms and provides the True RAD way for add-in development. As well as Add-in Express VCL, the .NET Edition supports the most popular applications of the Microsoft Office family:

- * Access
- * Excel
- * Word
- * Outlook
- * PowerPoint
- * FrontPage
- * MapPoint
- * Visio
- * Project

As well as the VCL Edition, ADX.NET adds to Visual Studio and Delphi IDE several COM add-in specific wizards and several components that make add-in development much easier than the built-in COM add-in wizard from Visual Studio.

Add-in Express components wrap all command bar controls available in Office's command bar system and provide easy access to their properties, methods and events.

The Add-in Express wizards generate add-in projects for five platforms supported by

Add-in Express:

- * Microsoft Visual C# .NET
- * Microsoft Visual Basic .NET
- * Microsoft Visual C++ .NET
- * Microsoft Visual J# .NET
- * Borland Delphi 8

You can find more details about Add-in Express .NET Edition at www.add-in-express.com

To show how COM add-ins can be developed on Add-in Express we have ported all our free sample add-ins, ADX Toys, to several platforms (VB, C#, C++, J#, Delphi 8) supported by ADX.NET. Setup packages of these add-ins include the complete source code:

- * ADX Toys.NET for Excel:

The ADX Team is looking forward to your feedback. We have set up forums to collect

your feedback and suggestions. The ADX Team will be actively participating in these

forums: <http://www.add-in-express.com/forum/>

Sincerely,

ADX Team
