Has anyone seen the following problem and if so how did they fix the problem ?

If I have a mailto: link in some html code such as

```
<a href="mailto:roy%40mywebsite%2ecom"> roy
```

In that the 'dot' and 'at' symbols have been replaced with the unicode versions. When viewing this link in IE 6 I get a nice translation to roy@mywebsite.com in the status bar at the bottom of the page.

But when you click on the link, in outlook 2000 you get roy%40mywebsite%2ecom in the to box. This is happening on some of our clients PCs but is not happening on others, all should have been setup the same but obviously are not.

Have you any clues to help me please

Roy
