So, in your macro, what statement triggers a security prompt? We may be able to solve the real problem, which is getting the code to run without prompts..

The only time I've seen anything like that password prompt is when the mail profile of the user working on the security forms doesn't match the Windows login account. You might try creating a new profile to see if it behaves differently.

There's no special quoting tag. It's just harder to follow the discussion if the relevant information is not kept together in one message.
