We have a W2K3 CA so generating user certificates is relatively easy... but what's the best way to install and configure the certs on each PC? The mail profiles will be automatically generated on logon using the CIW but I can't see how to add the certs automatically.

Signing Certs aren't stored in Outlook. They're stored in the Windows Crypto store that you can see either in IE's Tools>Internet Options>Content>Certificates or from the Management Console certmgr.msc
